

COMP1003 – Exam Questions for SE Overview Lectures

1) Software Quality is best monitored by a Software Quality Assurance Team. Using an example for each, state the four Software Quality Management activities that this team should think about.

[4 marks]

2) The key aims of Agile approaches are to adopt flexible processes, rather than rigid stages, and still maintain quality. These do not necessarily make projects faster and cheaper.

(i) State one reason why they might make projects faster and cheaper.

[1 mark]

(ii) State one reason why they might not make projects faster and cheaper.

[1 mark]

3) Describe how the four original values of the Agile Manifesto are represented in the Scrum technique.

[4 marks]

4) One thing you know for sure about the following project, is that you want to work with the blind users. Describe the different ways that you could involve them in the process, making reference to specific Agile methodologies, if relevant.

You work in a software development company that builds communication apps, reusing the same framework each time. You must plan a project for a new app for a charity for the blind (people who have lost their eyesight). The app is designed for two types of users, blind users and medical practitioners, to communicate. Since users may be partially or totally blind, your existing framework (in particular the user interface) will need to be adapted to accommodate a range of accessibility issues. The charity, and both types of users, will work closely with you. They have a plan for what they want the full software to do, but due to budget constraints, they want you to release the most important functions first. Next year, and each year after that, they hope to work with you again to release a new version of the app with more features.

[5 marks]

5) What are the three main strategies to handling project risks? Give an example of each type of strategy that could be used in the scenario above.

[6 marks]

6) There are two types of risks: risks for the software and risks for the project

(i) Explain the difference between risks for software and risks for the project

[2 marks]

(ii) Describe how identified software risks affect Requirements Engineering

[2 marks]
